Prasannam Clinic Management Dashboard - Case Study

Role: Project Architect & Solution Designer

Approach: Problem-driven, AI-assisted development

Objective: To streamline clinic operations and reduce inefficiencies in patient management

Table of Contents:

1. Context and Problem 2
2. Scope of Work 2
3. Development Process 2
4. Key Features 3
5. Technical Setup 4
6. Outcome 4
7. Notes 4
8. Project Screenshots: 4

1. Context and Problem

Prasannam Clinic, a child physiotherapy center, was managing its operations manually. This led to a **few recurring issues:**

- Patient data was spread across multiple formats
- Scheduling depended on manual coordination
- There was no reliable way to recover accidentally deleted records

The need was for a simple system that could bring these workflows together and make day-to-day operations more structured.

2. Scope of Work

I worked on structuring and building a solution around the clinic's workflow.

This involved:

- **Understanding** how patient intake, scheduling, and sessions were handled
- **Designing** the flow of information across these stages
- **Building and iterating** a working application using AI-assisted tools

The focus was on ***making something that would be usable in a real setting*** and functionally complete.

3. Development Process

Phase 1: Structuring the Workflow

- Mapped the patient journey from intake to recurring sessions
- Defined how patients, doctors, and schedules connect
- Chose a mobile-first approach based on how staff operate

Phase 2: Initial Build (MVP)

- Developed a basic version with:
- Patient directory

- Scheduling system

- Focused on clarity of data and ease of use

Phase 3: Testing and Iteration

Multiple test cycles were used to identify issues and refine the system:

- UI adjustments: Fixed layout issues across different mobile devices (especially around screen safe areas)

- Date and scheduling logic: Corrected inconsistencies in how dates were handled to avoid future errors

- General reliability: Tested different usage scenarios to ensure stability in day-to-day use

4. Key Features

Patient Directory

- Centralized view of patient details and records

Scheduling System

- Allows planning and tracking of therapy sessions

Data Recovery (Trash System)

- Soft-delete mechanism to restore removed records

Notifications

- Reminders before sessions and daily schedule updates

Access Control

- PIN-based lock for basic data protection

5. Technical Setup

- Frontend: React (Vite), Tailwind CSS

- Mobile layer: Capacitor

- Data handling: Local Storage (no backend dependency)

The system was designed to work reliably without requiring continuous internet access.

6. Outcome

The final application provides:

- A single place to manage patient and session data

- Basic safeguards against data loss

- A structured way to handle scheduling and reminders

7. Notes

This project was built using AI-assisted tools, with a focus on understanding the underlying workflow and ensuring the solution aligns with actual usage in a clinic environment.
